

ABOUT US

Since 2007 Olians Plast s.r.l. trades **thermoplastic materials**. Mainly in the luxury footwear.

In 2019, the company has integrated in its corporate strategy the concepts expressed in the **17 Sustainable Development Goals** defined in the UN 2030 Agenda. Therefore, a **circular economy model** is chosen with the goal of reducing environmental impacts by continuously enhancing and reintegrating into the production process those materials that were previously considered nothing more than waste.

Then **Olians 4 R.ecycle (REUSE, REDUCE, RECYCLE, RENEW)** was born for the production of thermoplastic polymers from pre-consumer by-products.

LIGHTEN YOUR FOOTPRINT

OLIFOUR®
The Sustainable Plastic

& MINUO
Carbon Transparency Service

Compared to a virgin material, **OLIFOUR** allow to **reduce**:

- **fossil-based raw material demand**, and consequently of all the process steps and the input of material and energy necessary to produce it in upstream phases;
- **up to 83,7% the primary energy demand** (considering the use of each energy carrier involved inside the system);
- **up to 81,7% the CO₂ eq. emissions** (considering transport process, production and all ancillary phases);
- **up to 87,5% the amount of waste produced.***

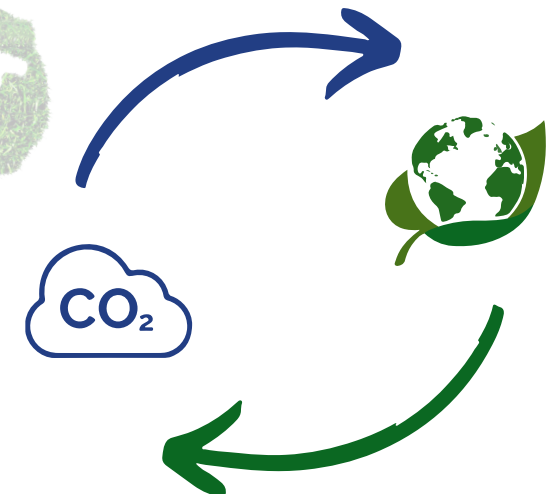

*Data from Olians internal study with LCA thinking approach, taking into analysis all the emission sources due to various process phases and including the activities upstream and downstream - Ex: supply, processing and trades of plastic granulate for the production of finished products.

MINUO is the new Olians Plast service aimed at promoting the Responsible Supply Chain.

Thanks to **MINUO** is possible to **quantify**, for a specific OLIFOUR's production, the **CO₂ amount issued into the atmosphere**.

For the same entity, **Olians Plast** is committed to **supporting traceable Ecosystem Services**, whose goals are to:

- mitigate the climate change;
- improve the forests' naturalness level;
- improve carbon dioxide absorption and storage.

OLIFOUR[®]

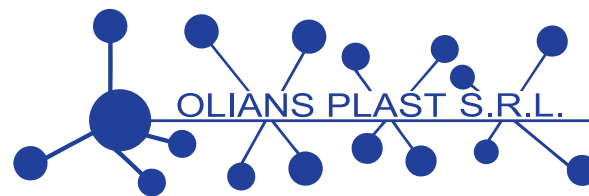

OLIFOUR is the thermoplastic polymers product line with **low environmental impact** made using recycled raw material.

Thanks to the **material's certified recycling method and a high production process**, is possible to obtain a high quality product with **the same characteristics as a virgin polymer**.
